WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). Bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties, all other cases are classified as "disease."

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all

diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant."

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

Because troops in transit and certain small detachments are not required to submit Reports, as well as for other reasons, the total strength of the reporting units as shown on this report has been consistently about four percent under the actual strength of the Army in the Continental United States.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 16 JUNE 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As shown in the chart on page 3, the admission rates from all causes, from all diseases combined, and from injury increased fractionally for the week ending 16 June 1944. For the current week, the admission rate from all causes was reported at 555 per thousand and the admission rate from disease at 484 per thousand or about 1 percent higher than the rates registered the previous week, which were the lowest recorded in 1944 and also under the lowest rates reported during 1942 and 1943. As compared with the corresponding week of 1943 current morbidity is about 23 percent lower.

Morbidity from injury was reported at 71 per thousand or somewhat above the rate for the previous week.

Respiratory Causes:

The admission rate from colds, influenza, etc. decreased for the seventeenth consecutive week being currently reported at 79 per thousand or only 4 percent below the rate for the preceding week and more than 40 percent under the rate for the corresponding week for 1943. The current week's admission rate from these causes is not only the lowest reported for 1944 to date but also below the lowest rates registered during 1942 and 1943.

The admission rate from pneumonia decreased to 7 per thousand, the lowest rate recorded so far this year and about 50 percent below the rate for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) increased to 33 per thousand, which is the highest rate experienced during 1944. The number of new cases of measles, mumps, and scarlet fever all declined appreciably. The number of new cases of measles and scarlet fever were by far the lowest recorded for any week this year. The number of new cases of mumps, however, remained relatively high although about 60 percent below the peak number for the week ending 24 March 1944. The number of new cases of meningitis decreased sharply to the lowest level reported so far this year. The number of new cases of rheumatic fever remained at about the same level as during the previous week.

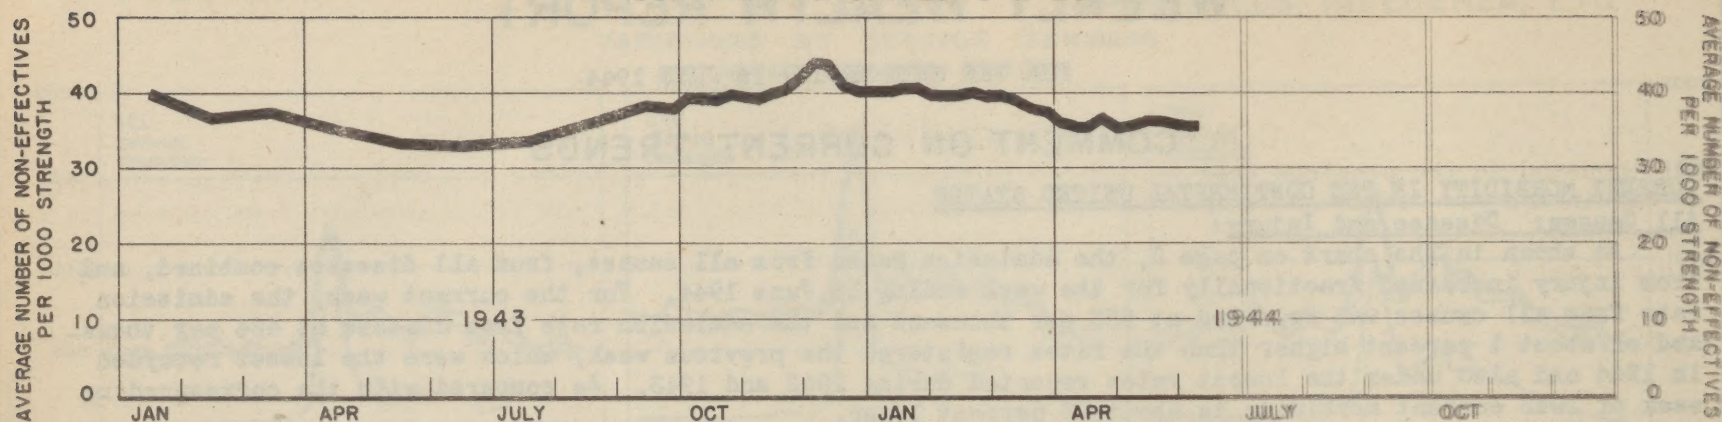

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

Changes in morbidity from all causes were of relatively small magnitude in most Service Commands. However, the Military District of Washington showed a sizeable decrease from the relatively high rate of 646

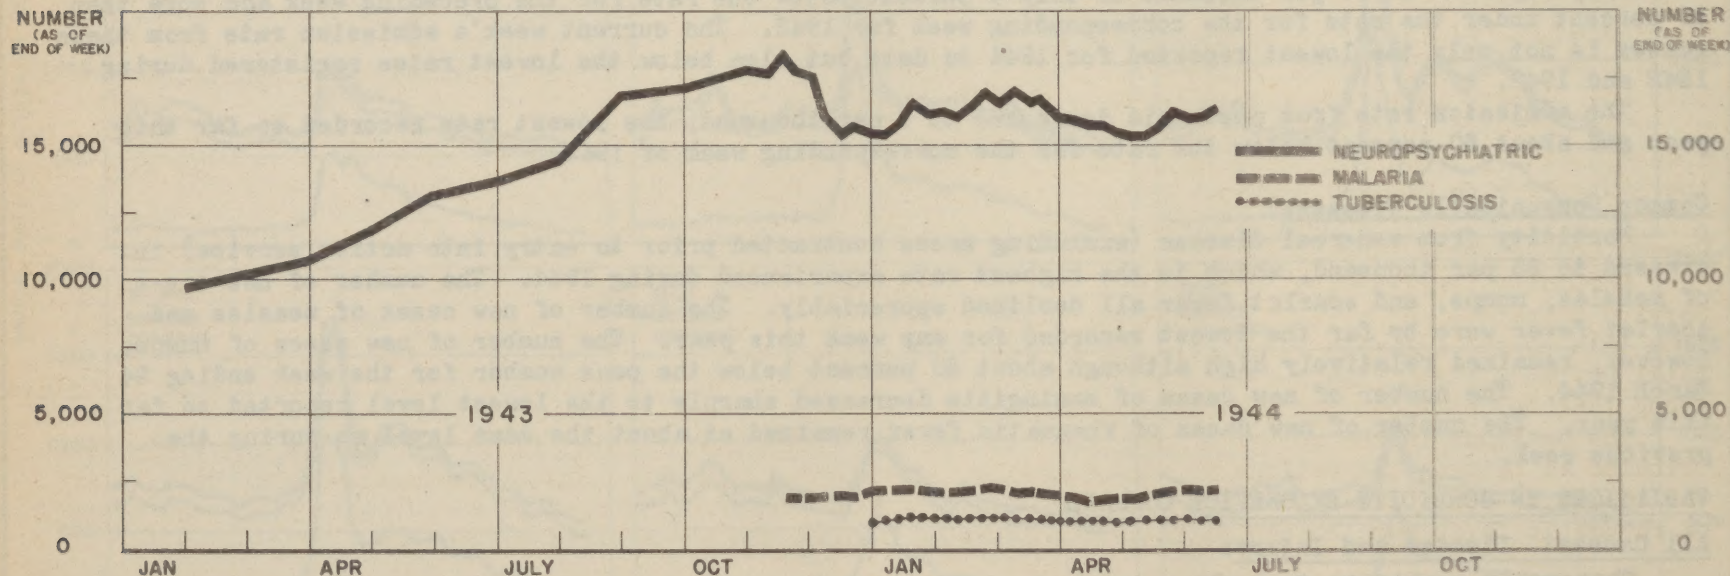

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 16 JUNE 1944

COMMENT ON CURRENT TRENDS (CONT'D)

per thousand in the previous week to 543 per thousand in the current week. As a result, the Military District of Washington was displaced as the one with the highest admission rates from all causes and from disease by the Fifth Service Command which had an all causes rate of 588 per thousand and by the Second Service Command which had a disease rate of 528 per thousand.

The Sixth Service Command, which in the early part of the year had close to the highest rates of admission of any Service Command, experienced the lowest rates during the current week (483 per thousand for all causes and 433 per thousand for disease).

Except for the Sixth Service Command, all Service Commands reported admission rates from all causes falling within the relatively narrow range of 530 to 588 per thousand. A sharp increase in the admission rate from injury was registered in the Fourth Service Command as a result of sizeable increases at four stations (Camp Blanding, Fla., Camp Forrest, Tenn., Ft. Jackson, S.C., and Camp McCain, Miss.).

Respiratory Causes:

Most of the Service Commands reported substantially the same admission rate from colds, influenza, etc. The Second and Ninth Service Commands showed decreases of more than 10 percent, while the Third Service Command was the only one to register a sizeable increase. The Seventh Service Command continued to be the only one to have morbidity from this cause in excess of 100 per thousand.

The decrease in the admission rate from pneumonia for the total United States resulted chiefly from lower morbidity from this cause in the Third, Sixth, and Eighth Service Commands. Nevertheless, the rate for the Sixth Service Command continued to be twice as high as that for the country as a whole.

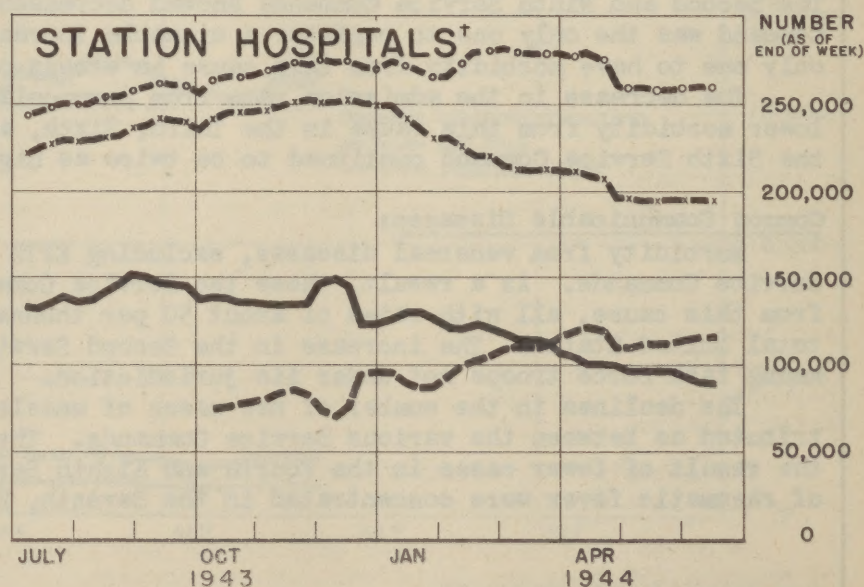

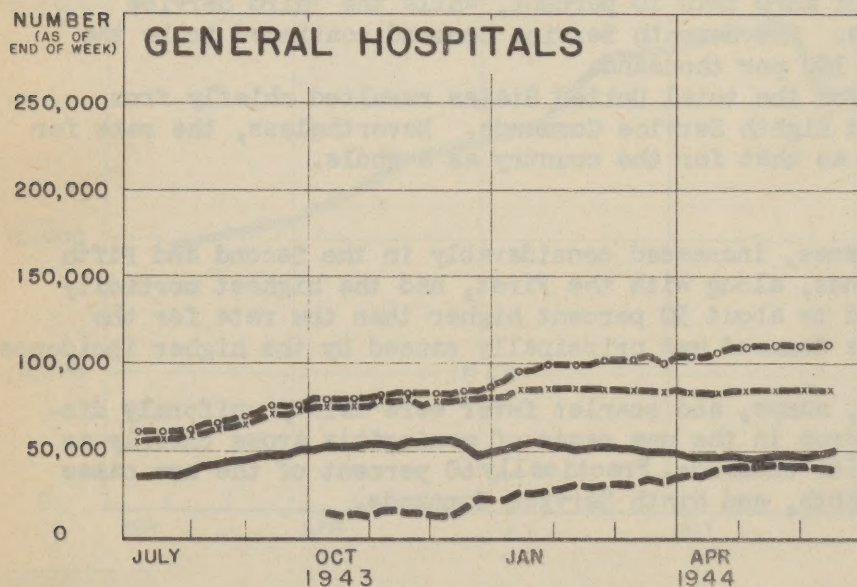

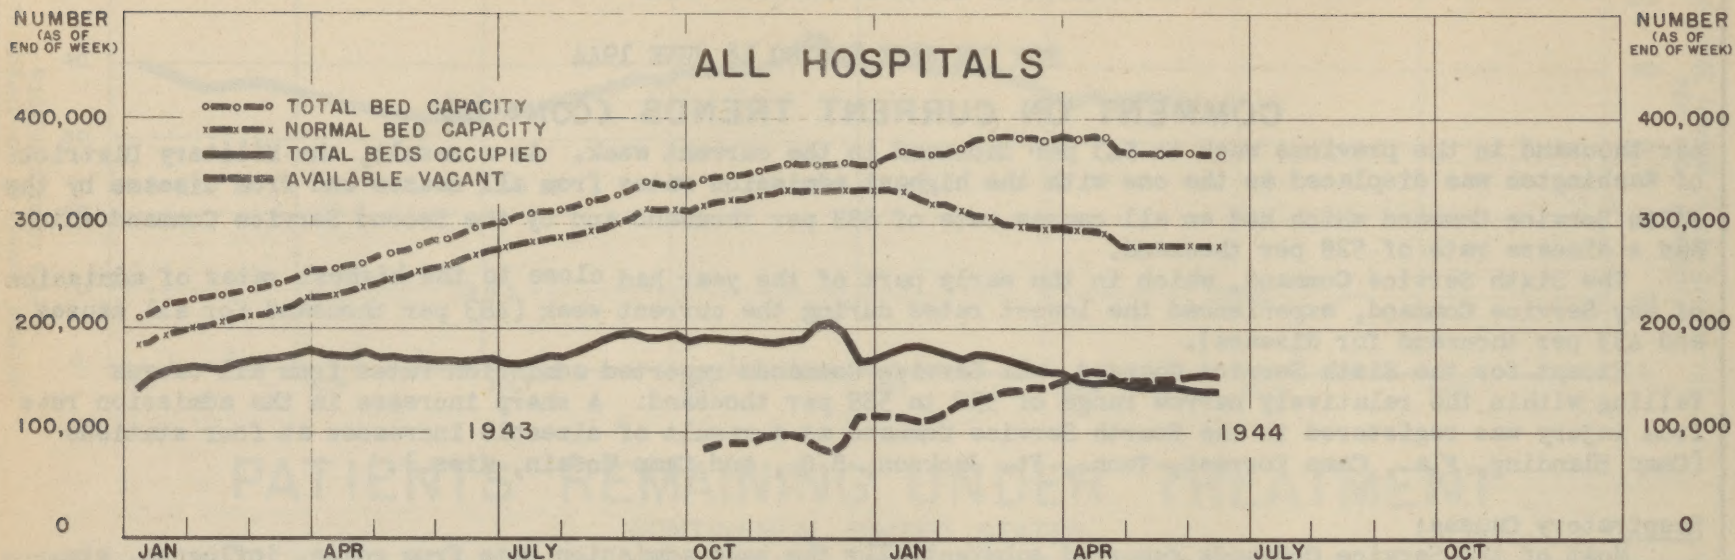

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases, increased considerably in the Second and Fifth Service Commands. As a result, these two Service Commands, along with the First, had the highest morbidity from this cause, all with rates of about 50 per thousand or about 50 percent higher than the rate for the total United States. The increase in the Second Service Command was principally caused by the higher incidence among task force troops not under its jurisdiction.

The declines in the number of new cases of measles, mumps, and scarlet fever were fairly uniformly distributed as between the various Service Commands. The drop in the new cases of meningitis arose chiefly as the result of fewer cases in the Fourth and Eighth Service Commands. Practically 60 percent of the new cases of rheumatic fever were concentrated in the Seventh, Eighth, and Ninth Service Commands.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 16 JUNE 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week remained at 35 per thousand strength. The number of neuropsychiatric cases remaining as of 16 June 1944 was reported at 16,297 or about 300 more than for the previous week. The number of malaria cases under treatment has increased steadily in recent weeks from a low of 1,748 on 14 April to 2,183 on 16 June 1944; only 36 of these cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,140. The number of battle casualty patients remaining as of 16 June was 6,600 which is the highest figure reported so far.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 16 June 1944 was reported at about 367,100 or about the same as at the end of the previous week. The number of beds occupied was 138,700 or about the same as for the previous week, while the number of "available vacant" beds remained at 155,300. Total beds occupied represented 38 percent of total bed capacity. There were 8 stations with bed capacity of about 11,000 having no "available vacant" beds; two General Hospitals with a bed capacity of about 4,000 included among them.

The number of normal beds remained at about 280,000 or 76 percent of the total bed capacity. Included in the normal bed capacity were 422 T/O hospital beds and tentage, while the total bed capacity included 482 such beds, of which 42 were occupied.

The total bed capacity of General Hospitals was reported at about 110,000 (the highest figure so far attained); about 49,000 of these beds (or 45 percent) were occupied. The "available vacant" beds at General Hospitals numbered 39,000. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of T/O hospital beds and tentage mentioned above) decreased to 257,000, the lowest level reported since October 1943. Normal beds in these hospitals remained at about 195,000. Total beds occupied as of 16 June 1944 numbered 90,000 (or 35 percent of the corresponding total bed capacity) which is the lowest level reported during 1943 and 1944 to date. Station Hospitals had 116,000 "available vacant" beds as of 16 June 1944.

The letters (RH) appear after the names of stations which have been designated as AAF or ASF regional hospitals in accordance with Section II, WD Circular No. 228, cs.

As of 16 June 1944 the bed capacity of convalescent facilities in General Hospitals numbered 14,546 beds of which 4,450 beds (or 31 percent) were occupied.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 26 MAY 1944

COMMENT ON RECENT DEVELOPMENTS

The data of this Supplementary Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 26 May 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Supplementary Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal disease and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 35. Similar charts for specified diseases appear on pages 37, 39, and 41. A chart showing mortality trends is presented on page 43. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 44. The most pertinent morbidity data for individual stations are presented on pages 45 to 70. On pages 71 and 72 the six stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on Page 2. Hereafter, the term "month" will be used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Morbidity from all causes and from disease decreased in May for the fourth consecutive month and was about 5 percent lower than during April. The admission rate from all causes has declined more than 40 percent over the five month period January - May 1944, almost entirely due to lower morbidity from respiratory causes. The annual admission rate from all causes for May was at the lowest figure since December 1941, being reported at 605 per year per 1000 strength or more than 20 percent below that for May 1943.

The admission rate for injury increased fractionally from the very low level prevailing during the previous month to a rate of 68 per thousand.

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Lower morbidity from disease during May as compared with April was reported by every Service Command except the Military District of Washington which showed a relatively small increase. The largest decreases occurred in the Second, Sixth, and Seventh Service Commands, each of which showed declines of about 100 per thousand in the admission rate, principally because of corresponding decreases in morbidity from respiratory causes.

The Military District of Washington reported the highest admission rates from all causes and from disease (about 25 percent higher than for the country as a whole), followed by the Second Service Command with a rate only about 15 percent higher than for the country as a whole. The lowest admission rates from all causes and from disease - about 10 percent below those for the United States as a whole - were registered in the First Service Command. It is noteworthy that as the incidence of morbidity from respiratory causes decreases, there is less variation between the several Service Commands both from a relative and an absolute standpoint.

RESPIRATORY DISEASES:

The admission rate from colds, influenza, etc. declined from 159 per thousand in April to 121 per thousand in May, a decrease of about 25 percent. The rate for May was about 40 percent below that for the corresponding month of 1943 and about 35 percent below that for May 1942. Morbidity from respiratory causes has followed much the same trend in 1944 as in 1943 but with the admission rates being about a third lower. Nonetheless, the admission rate from these causes for May was 25 percent above the minimum rate registered during 1943 (in August).

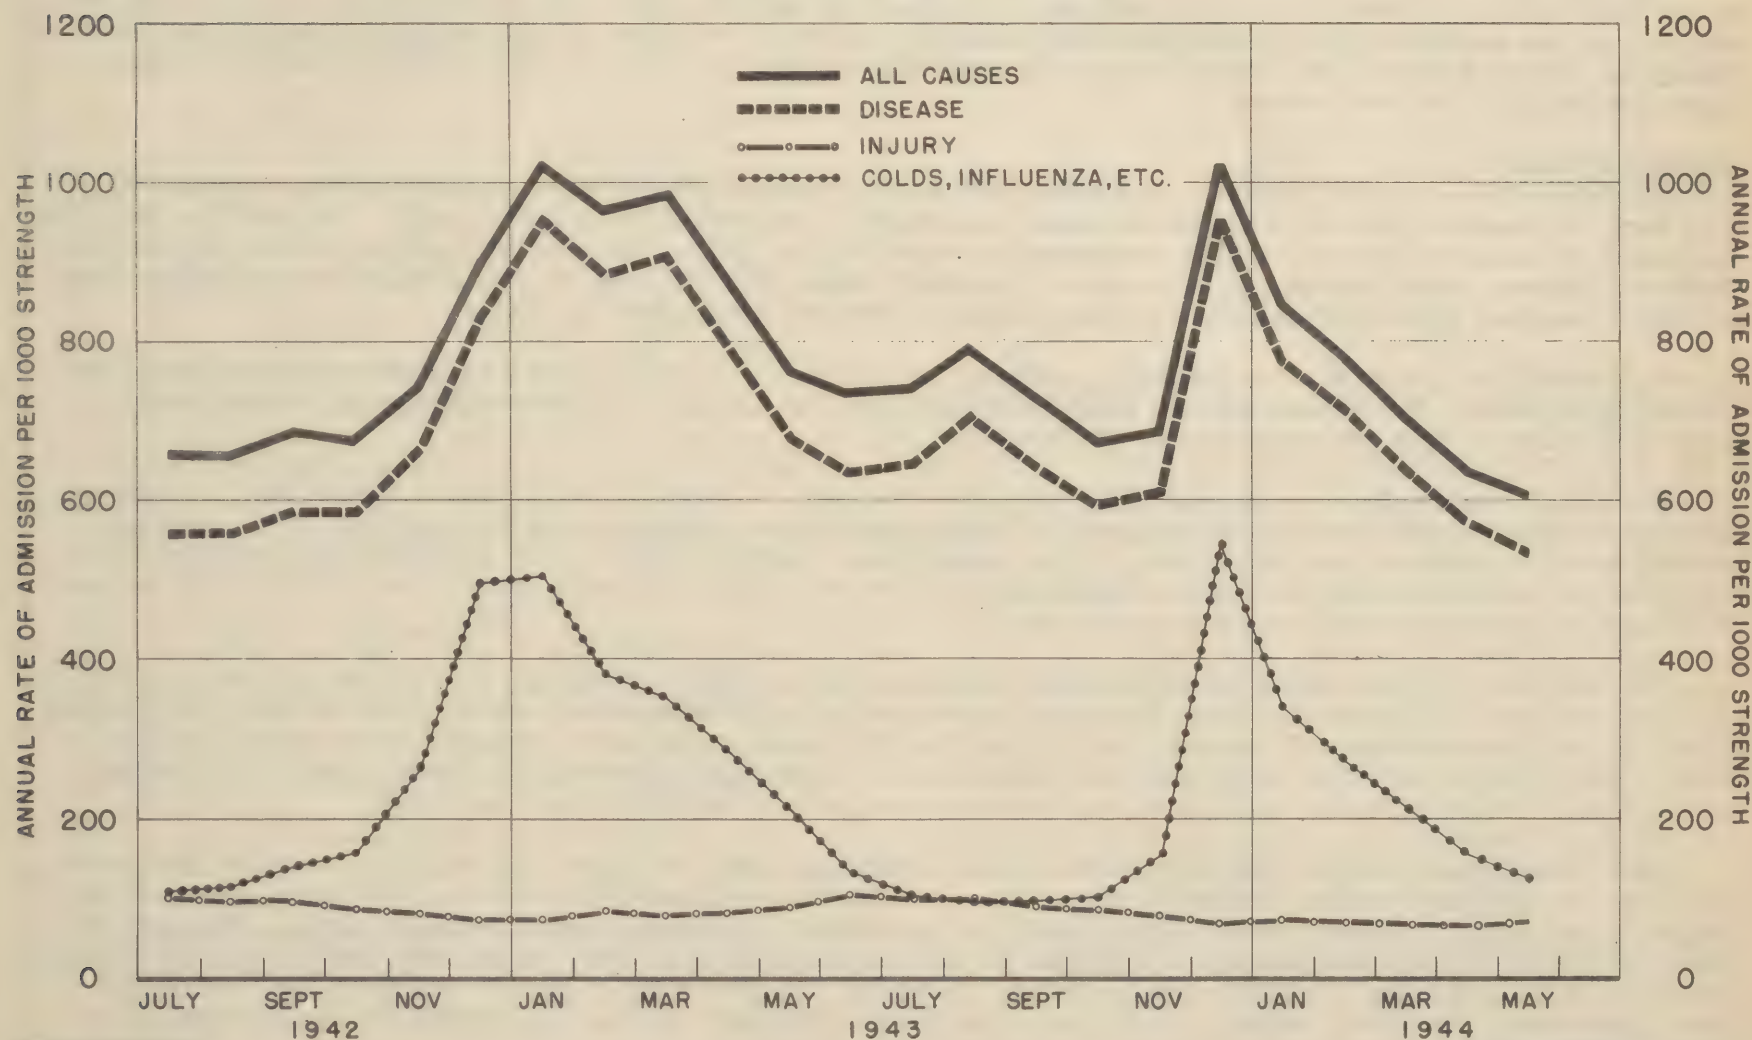

Lower morbidity from colds, influenza, etc. was again registered in every Service Command, the largest decreases being in the Second, Sixth, and Seventh Service Commands all of which showed declines in the admission rate of about 80 per thousand or more. Despite the large decreases in morbidity, the latter two Service Commands continued to report the highest admission rates of about 170 per thousand from these causes, or about 40 percent higher than for the country as a whole. The Fourth Service Command reported the lowest rate of admission from colds, influenza, etc. (94 per thousand or about 25 percent lower than the rate for the entire United States).

Morbidity from all types of pneumonia again registered a decrease of about 20 percent. The annual admission rate of 10.6 per thousand for May was about 35 percent lower than for the corresponding month of 1943. The Sixth Service Command continued to report by far the highest morbidity from pneumonia having an admission rate almost twice as high as that for the country as a whole, despite a decrease of more than one-third in the morbidity rate from this cause during May as compared with April. The lowest admission rate from pneumonia was again reported by the Ninth Service Command.

Atypical pneumonia accounted for more than 60 percent of the total admissions, the highest proportion so far recorded. The percentage of pneumonia cases diagnosed as atypical was highest in the Fourth Service Command and the Military District of Washington (more than 75 percent).

MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery increased by about 20 percent in May as compared with April but was at the relatively low level of 7.5 per thousand (or almost 20 percent under the corresponding rate for May 1943). Reversal of the downward trend in the morbidity from this cause is evidence of the seasonal trend to be expected during the warmer months. The Fourth Service Command with a rate of almost 12 per thousand registered the highest morbidity from this cause.

VENEREAL DISEASE:

Morbidity from venereal disease, excluding EPTS cases, increased by about 7 percent in May as compared with April to reach a rate of 31.7 per thousand, the highest registered since March 1942. The rate for May 1944 was almost 25 percent higher than the corresponding rate for May 1943. The entire increase is due to gonorrhea since the current level for syphilis is about 15 percent under that recorded in 1943, while the morbidity from all other venereal diseases has recently been almost 40 percent lower than in 1943.

The Second and Fifth Service Commands continued to report the highest morbidity from venereal disease excluding EPTS cases. The former shows a relatively high rate of admission largely because of the incidence among task force troops not under its jurisdiction.

Morbidity represented by venereal EPTS cases was reported at about 20 per thousand during May, a decrease from the rate of 26 per thousand during April. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance because they reflect different geographical distributions of Army personnel as compared with that of new inductees, different proportions of white and colored inductees, and varying administrative practices.

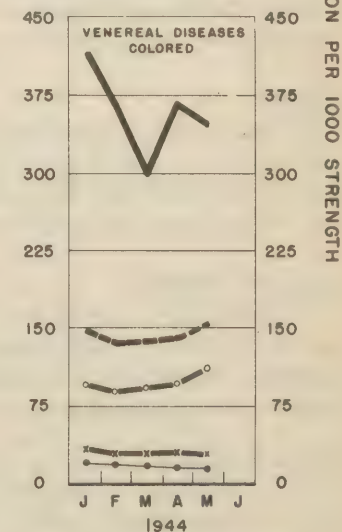

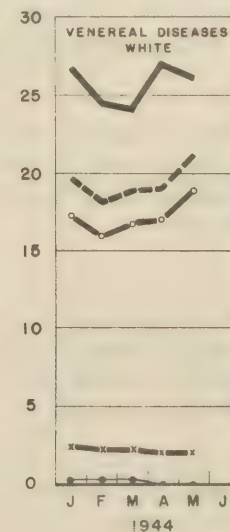

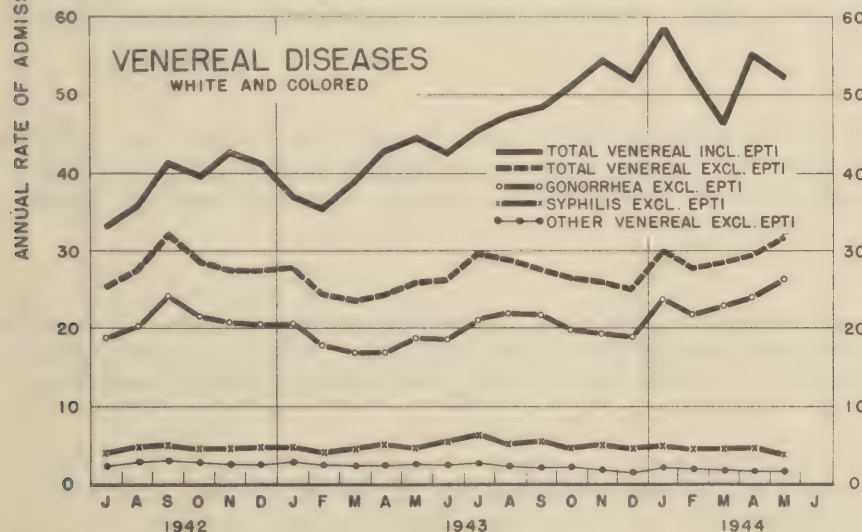

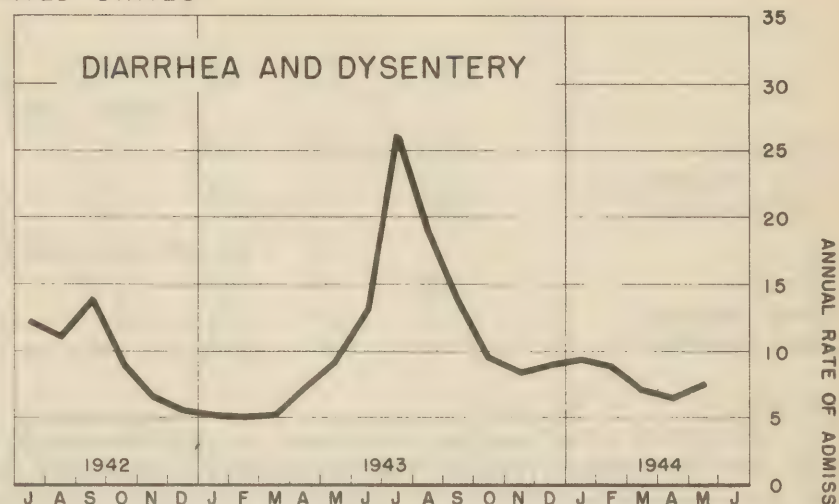

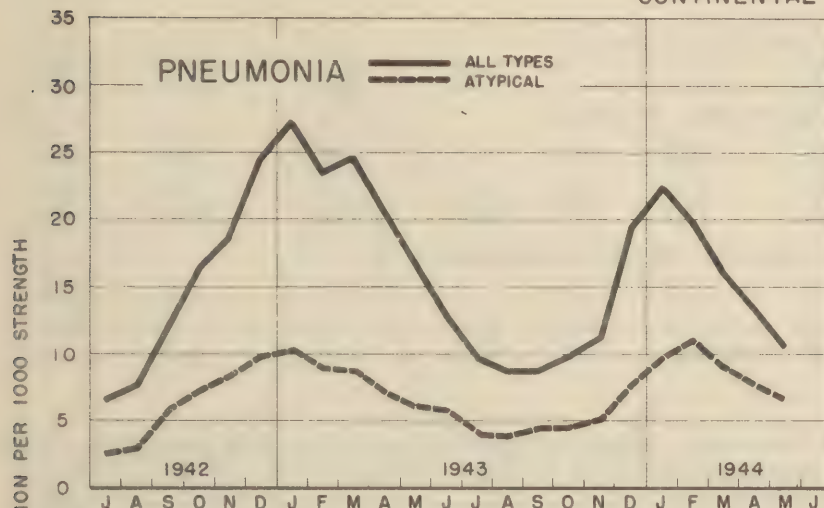

The very much higher incidence of venereal disease among colored as compared with whites is indicated in the chart on page 37. Morbidity from venereal disease excluding EPTS cases was seven times as high for colored troops as for the remainder of the Army, while for the EPTS cases the colored rate was about thirty times as great. The detailed data for April 1944 are contained in the Supplementary Health Report (page 33) of Weekly Health Report No. 23; the May data here presented are preliminary and subject to revision.

Data on venereal disease (excluding EPTS) cases remaining under treatment in hospital at end of the month are shown in the table on the following page. This table indicates that .86 percent of the total patients in hospitals are syphilis cases, while 1.47 percent are gonorrhea and other venereal disease cases. The very much longer duration of hospitalization for syphilis is indicated by the fact that while less than 15 percent of the venereal admissions were for this cause, syphilis accounted for more than 35 percent of the cases remaining under treatment. The total number of days lost from duty on account of venereal disease during May numbered about 96,000 representing a non-effective rate of .81 per thousand.

MEASLES:

Morbidity from measles continued to show the expected seasonal trend decreasing again during May from the peak rate reached in March; the decrease in April and May was more than 50 percent. The incidence of measles has been much lower (about 50 percent) this year as compared with the previous year. The Sixth, Seventh, and Eighth Service Commands experienced the highest morbidity from this cause but were nonetheless relatively low as compared with previous months and with previous years.

MUMPS:

Morbidity from mumps decreased somewhat in May from the relatively high level prevailing during the previous two months. Morbidity from this cause was notably lower than during the corresponding months of 1942 and 1943. The First and Seventh Service Commands had the highest admission rates from this cause, about 60 percent above the rate for the country as a whole.

SCARLET FEVER:

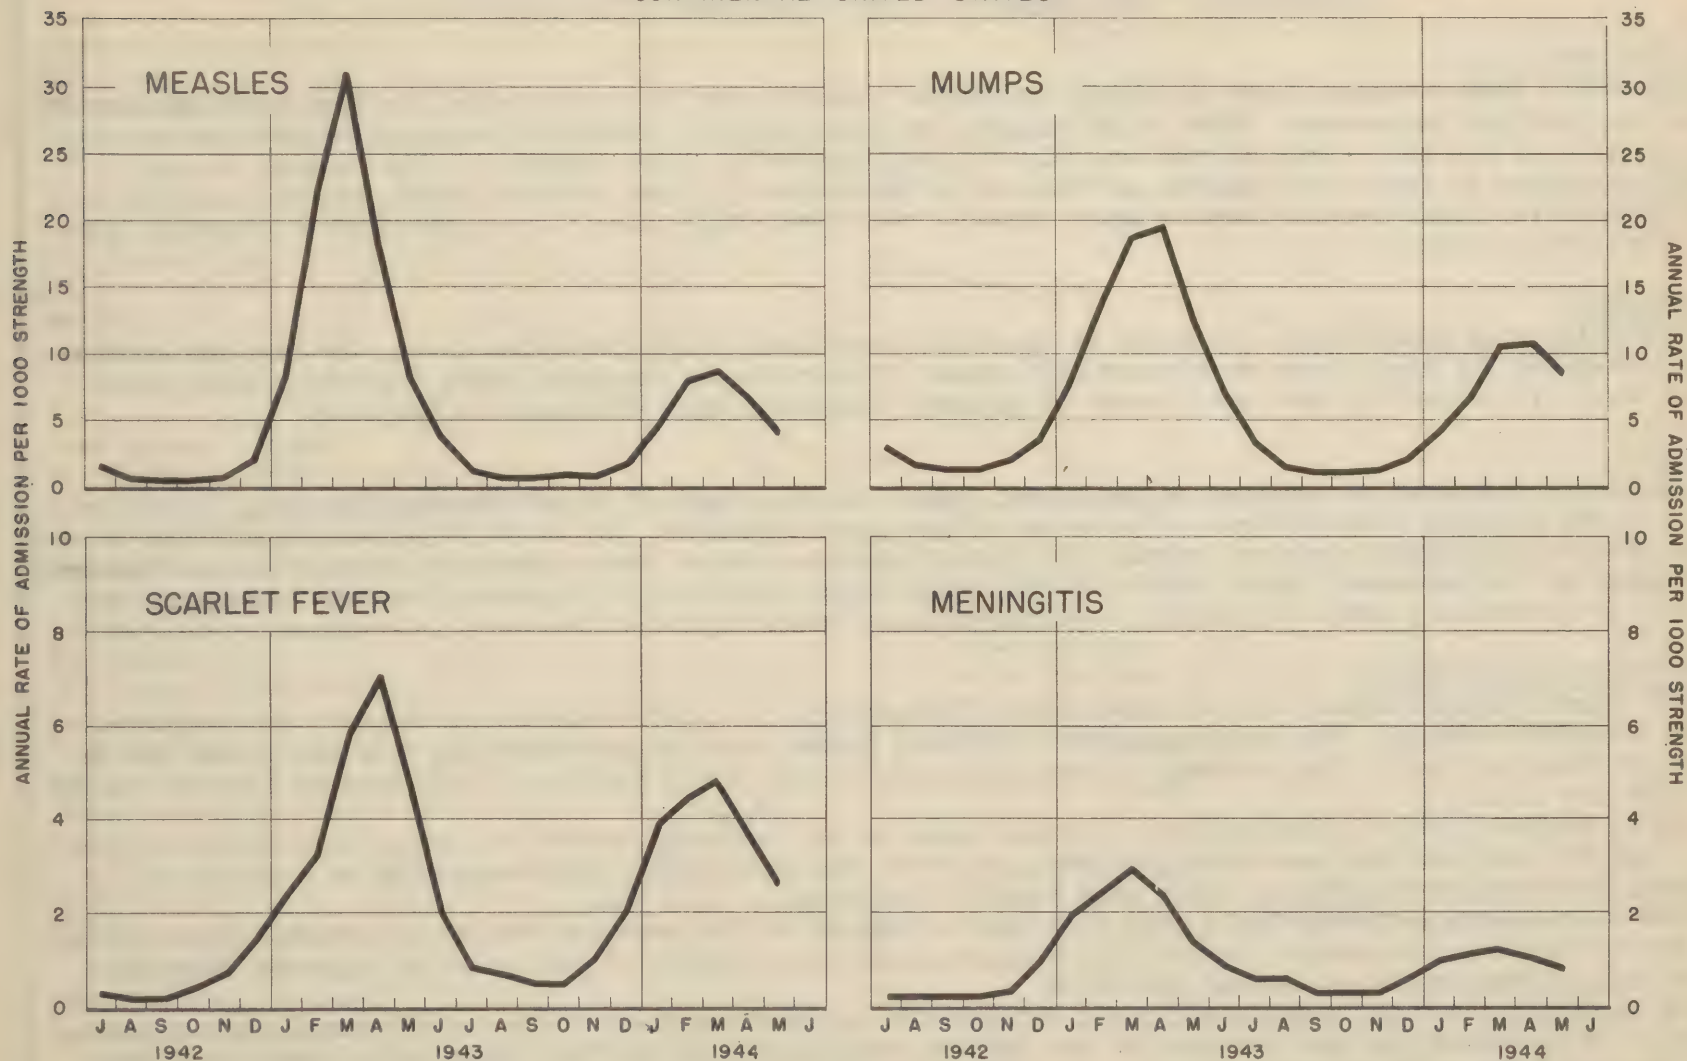

Morbidity from scarlet fever continued to decrease and was reported at 2.6 per thousand for May. This rate was only about half the corresponding rate for May 1943 but was double that for May 1942. The Sixth and Seventh Service Commands continued to report by far the highest morbidity from this cause, both having rates more than double that for the United States as a whole.

MENINGITIS:

Morbidity from meningitis again decreased slightly and for May was reported at .8 per thousand. This is about 40 percent lower than the rate reported for this cause in May 1943 although twice as high as the corresponding rate in 1942. The Third Service Command continued to report the highest incidence of meningitis with a rate almost double that for the country as a whole.

MORBIDITY FROM — MEASLES—MUMPS SCARLET FEVER—MENINGITIS

CONTINENTAL UNITED STATES

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever at a rate of 2.2 per thousand for May continued at the same high level as during the previous two months. This is the highest level of morbidity from this cause since Pearl Harbor with the exception of May 1943 when the rate was only slightly greater (2.5 per thousand). The Seventh Service Command continued to report the highest morbidity from this cause (7.2 per thousand or 20 percent less than in April), while the Sixth Service Command again showed a relatively high rate (5.2 per thousand or somewhat less than the previous month).

TUBERCULOSIS:

Morbidity from tuberculosis continued at about the same level as has prevailed during the last six months. As of the end of the month there were about 1125 cases of tuberculosis remaining under treatment; these represented about .75 percent of the total number of patients remaining under treatment in hospital.

MALARIA:

Morbidity from malaria acquired in the United States was at a rate of .2 per thousand for May. In accordance with the expected seasonal trend, the number of new cases during May was about 50 percent higher than during April. Malaria presumably acquired outside the United States accounted for an admission rate of 5.7 per thousand, the highest so far recorded. As of the end of the month there were about 2150 cases of malaria remaining under treatment, representing about 1.4 percent of total patients remaining under treatment in hospital.

NEUROPSYCHIATRIC DISORDERS:

The annual rate of admission from these causes increased to 32.2 per thousand, the highest rate reported during the last 6 months. This rate was about 50 percent higher than the corresponding rate prevailing during the early months of 1943. The increases in May as contrasted with April occurred in all Service Commands except the Fifth and Sixth.

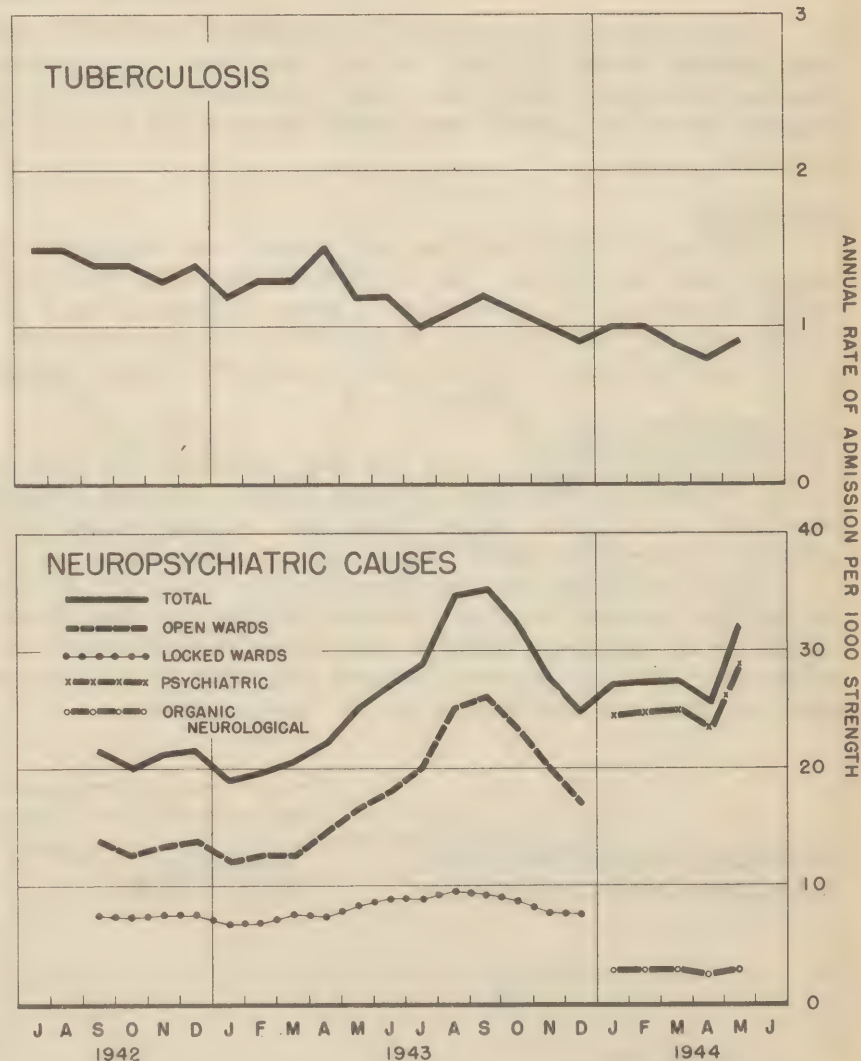

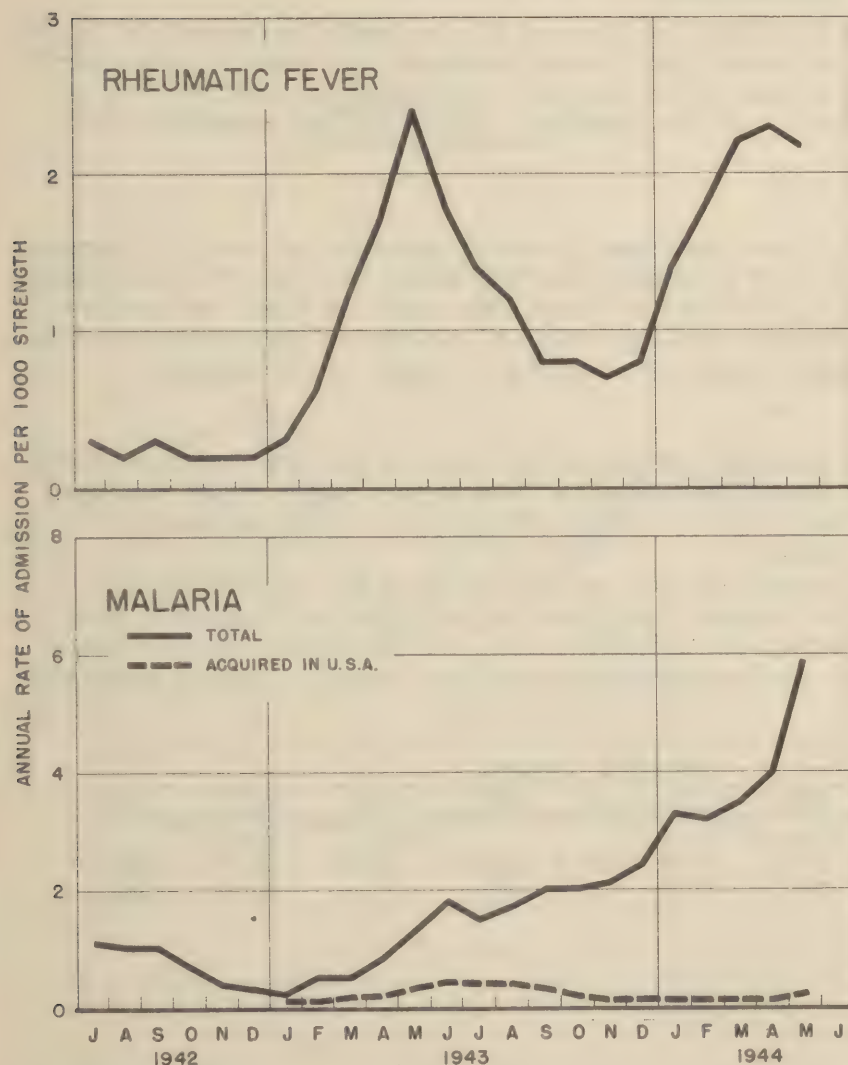

It is believed that a portion of the increase shown is the result of efforts to obtain more accurate reporting. When the new Form 86ab was first put into use, there was considerable under-reporting at a number of stations, and steps were taken to obtain more complete reporting.

The Second Service Command had a very high rate of admission from neuropsychiatric disorders (almost double that for the country as a whole), principally because of the large number of admissions at Atlantic City AAF Redistribution Station and at General Hospitals.

As in previous months, psychiatric cases accounted for about 90 percent of the total neuropsychiatric admissions. This proportion held for most of the Service Commands except the First where only 1 percent of the cases were reported as organic neurological and the Military District of Washington and the Sixth Service Command where over 15 percent of the cases were reported as organic neurological.

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES

SUPPLEMENTARY HEALTH REPORT

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The number of neuropsychiatric cases remaining under treatment at the end of the month increased to 16,162, the highest level attained so far this year. Both open and locked ward cases increased as compared with April. Neuropsychiatric cases remaining represented 10.8 percent of the total patients remaining in hospital for all causes, with the locked ward cases accounting for 3.4 percent and the open ward cases for the remaining 7.4 percent.

MORTALITY:

The mortality rate from all causes was reported at 2.43 per year per thousand strength or about 15 percent higher than for April. The reported mortality rate from injury accounted for the major portion of the increase since the mortality rate from disease increased only slightly and was at about the same low level as had prevailed during the previous six months. Recent studies indicate that reporting of deaths on Form 86ab is incomplete, particularly deaths from injury for which the understatement is possibly as great as 25 percent.

NON-EFFECTIVE RATE:

The non-effective rate for May was 36.1 per thousand strength or about the same as for the previous month and 7 percent higher than for May 1943. For May 1944 the non-effective rate from injury was 7.9 per thousand strength or slightly higher than the corresponding rate for April. At least 10 percent of the current non-effective rate represents days lost by evacuees from overseas.

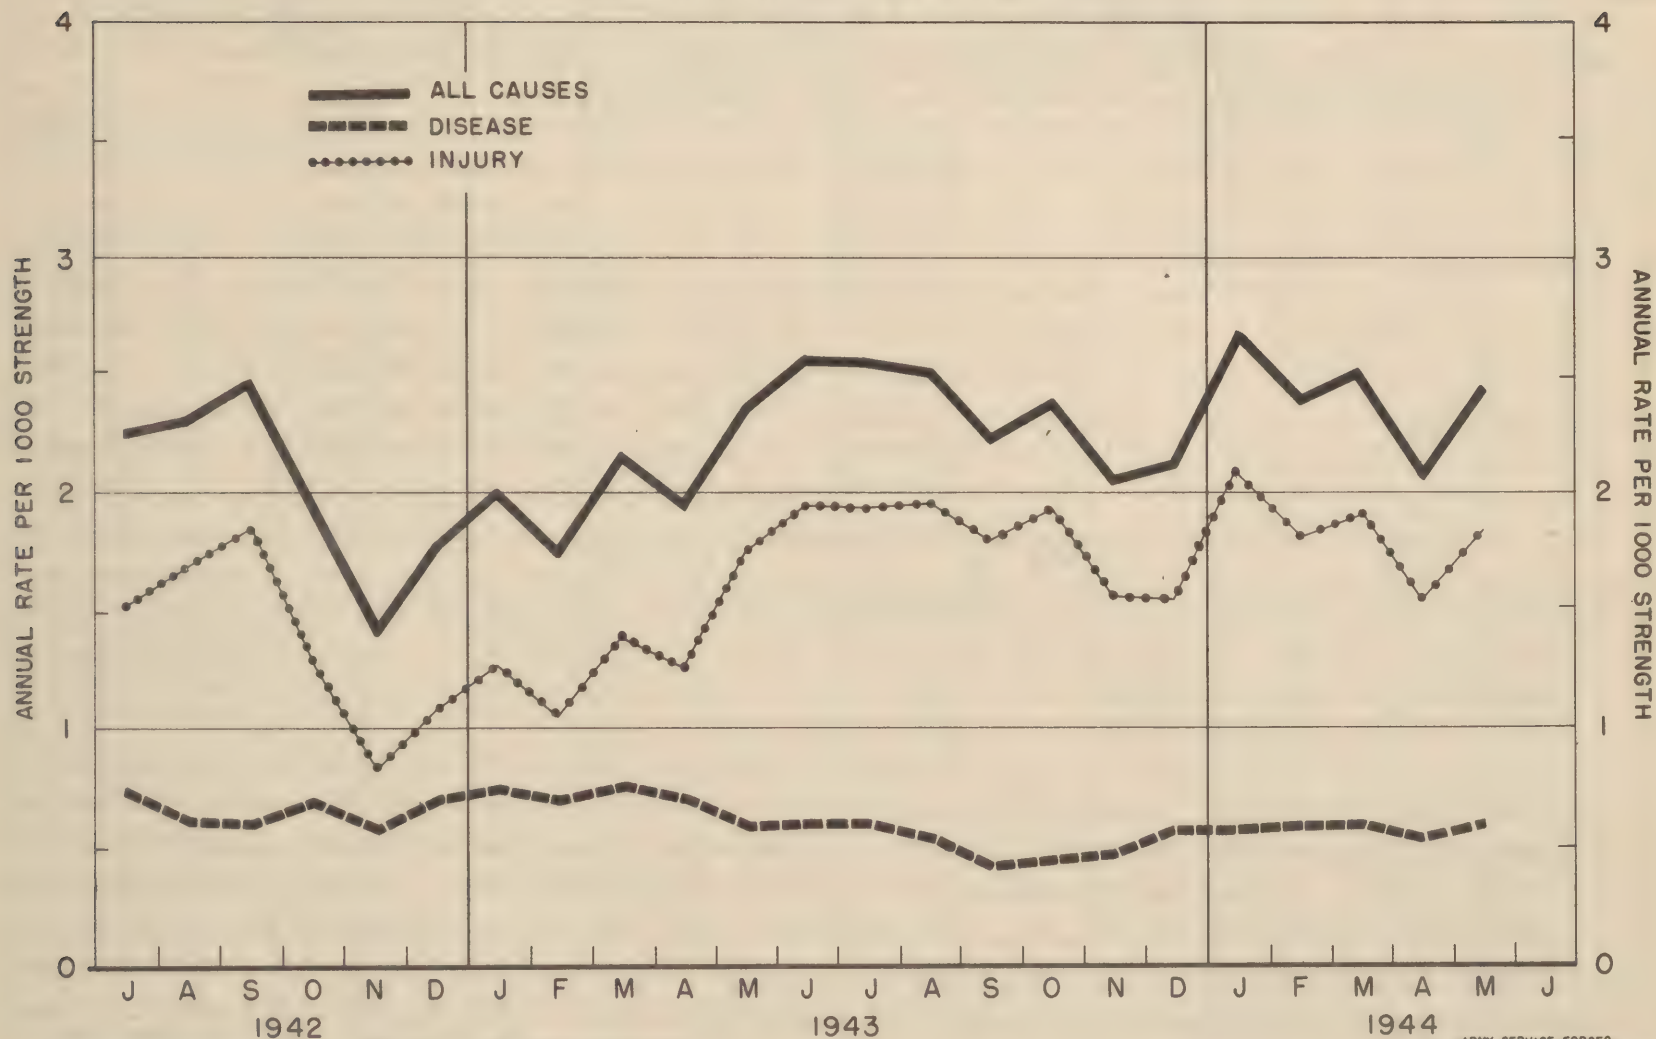

The variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:

	Service Command									
	I	II	III	MDW	IV	V	VI	VII	VIII	IX
Including General Hospitals	35.5	45.0	37.3	75.0	30.8	49.7	40.6	37.0	31.6	38.7
Excluding General Hospitals	23.5	22.8	25.1	28.1	22.9	19.4	25.3	25.6	21.9	26.5
